state-information ceiling
$\mathbb{E}[p_{\mathrm{op}}(1-p_{\mathrm{op}})]$ (slow variables not in $Z$)
observer-induced current
$J=\Omega\Sigma^{-1}y\rho$, $\Omega=\frac{1}{2}[C(1)-C(1)^{\top}]$
S2, S5, E4
latent Markov state
$Z_t=(x_t,c_t)$
trailing windows
$y_t=\sum_a k(a)\,x_{t-a}$
fitted Markov model
(OU, MSM, AMC)
hitting score
$S=v_h^B(y_t)$
calibration
$g(S)\to$ forecast
compression leak $\mathbb{E}[(r^*-p_{\mathrm{op}})^2]$
S1, S4 (exact for Gaussian $x$)
estimator/calibration leak $\approx$ REL
E3, E5, E6
